

Virgo Big Picture

Main online data streams from detector to analysis

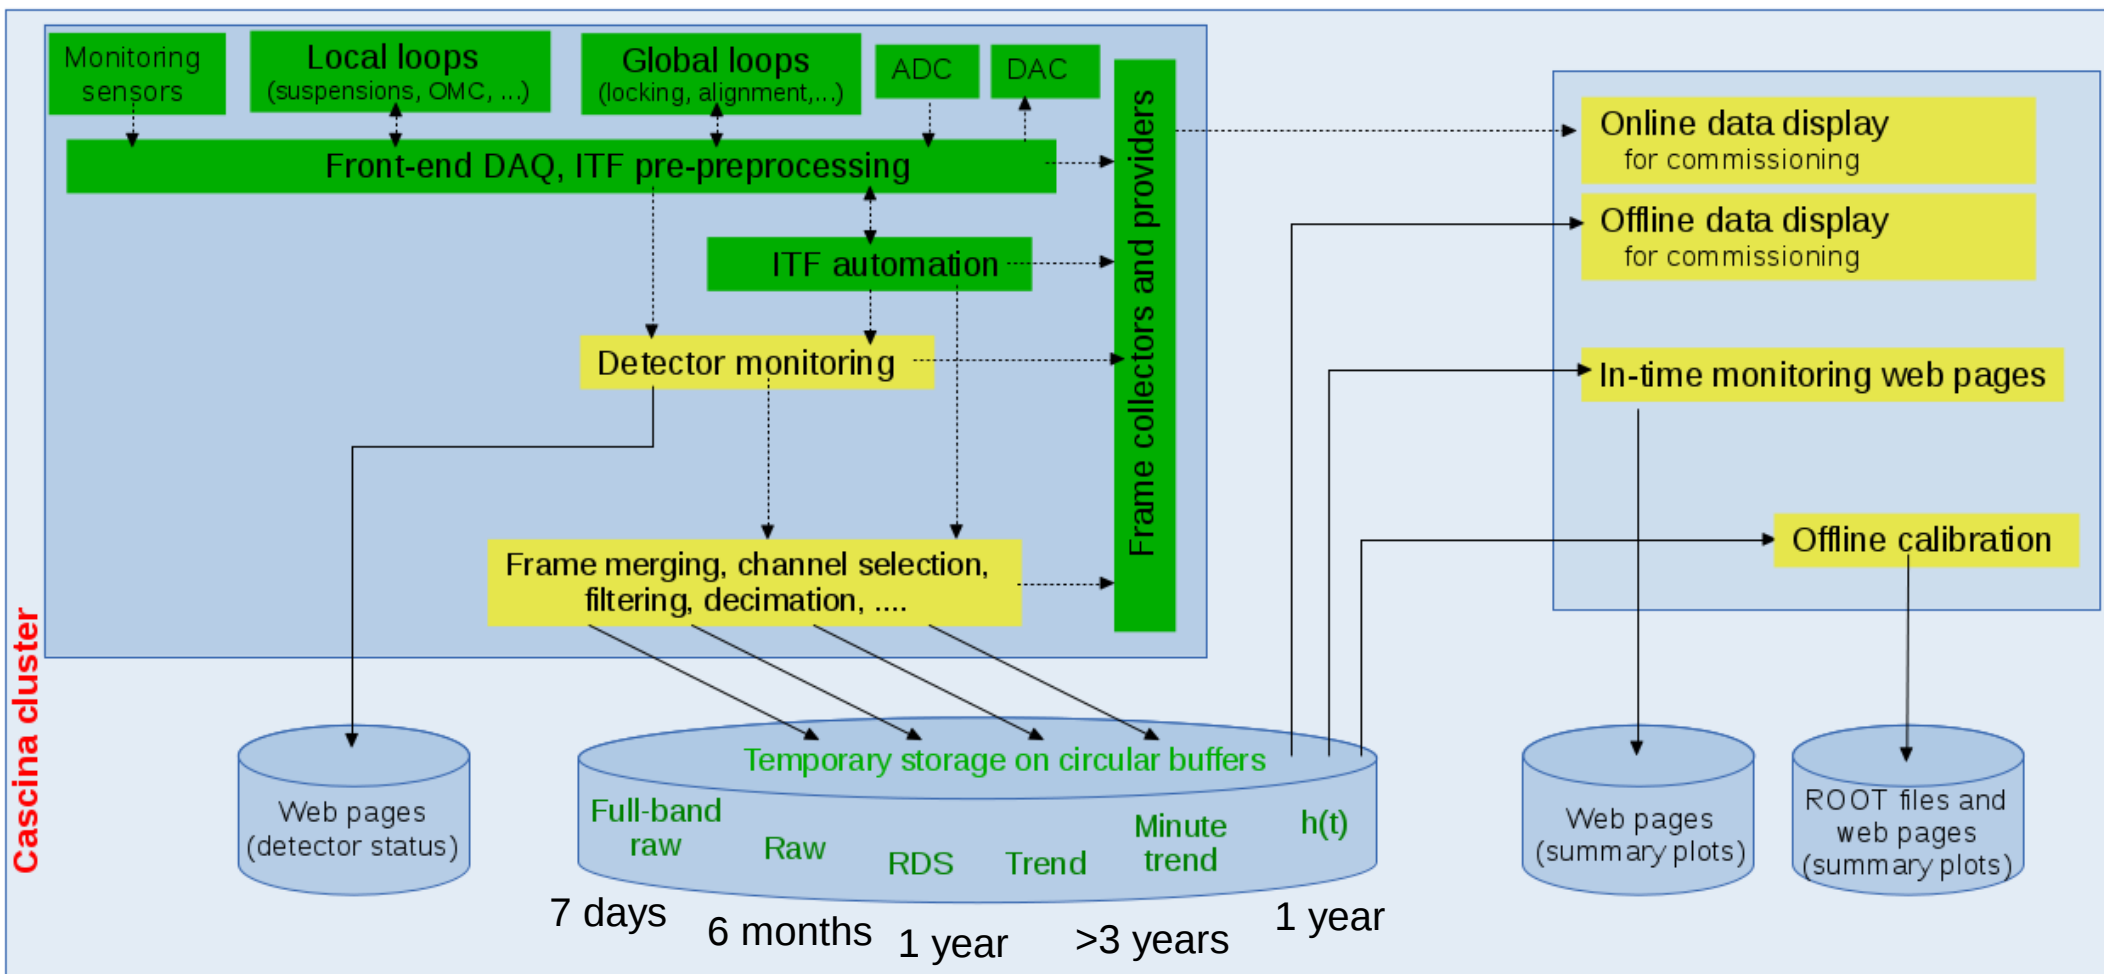

- DAQ streams overview
- Online $h(t)$ and DQ at Cascina
- Low latency data transfer
- Virgo data storage and offline analysis
- Hardware injections
- $h(t)$ and DQ reprocessing

General overview

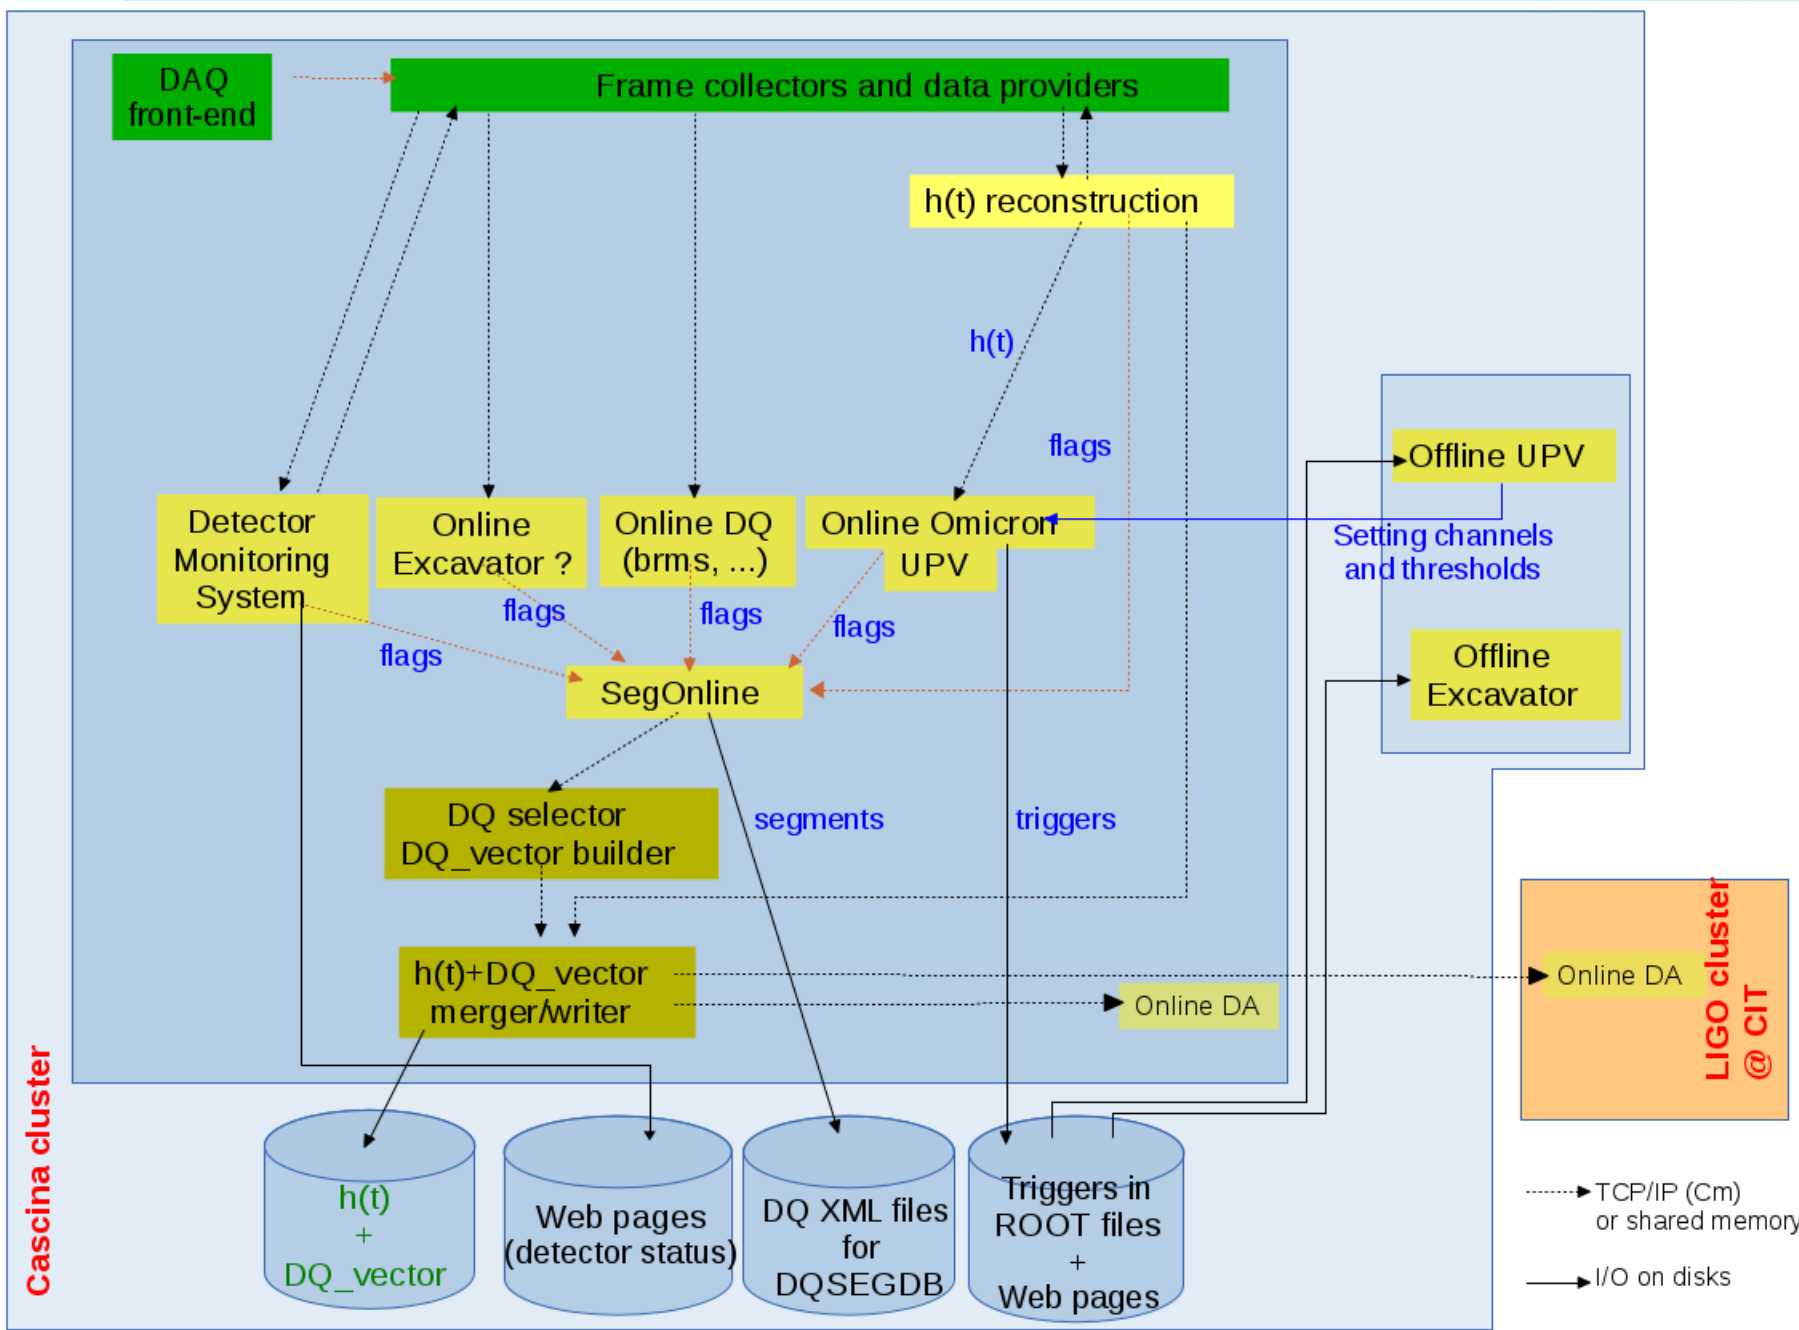

Virgo Computing Centers (CCs)

DAQ streams overview

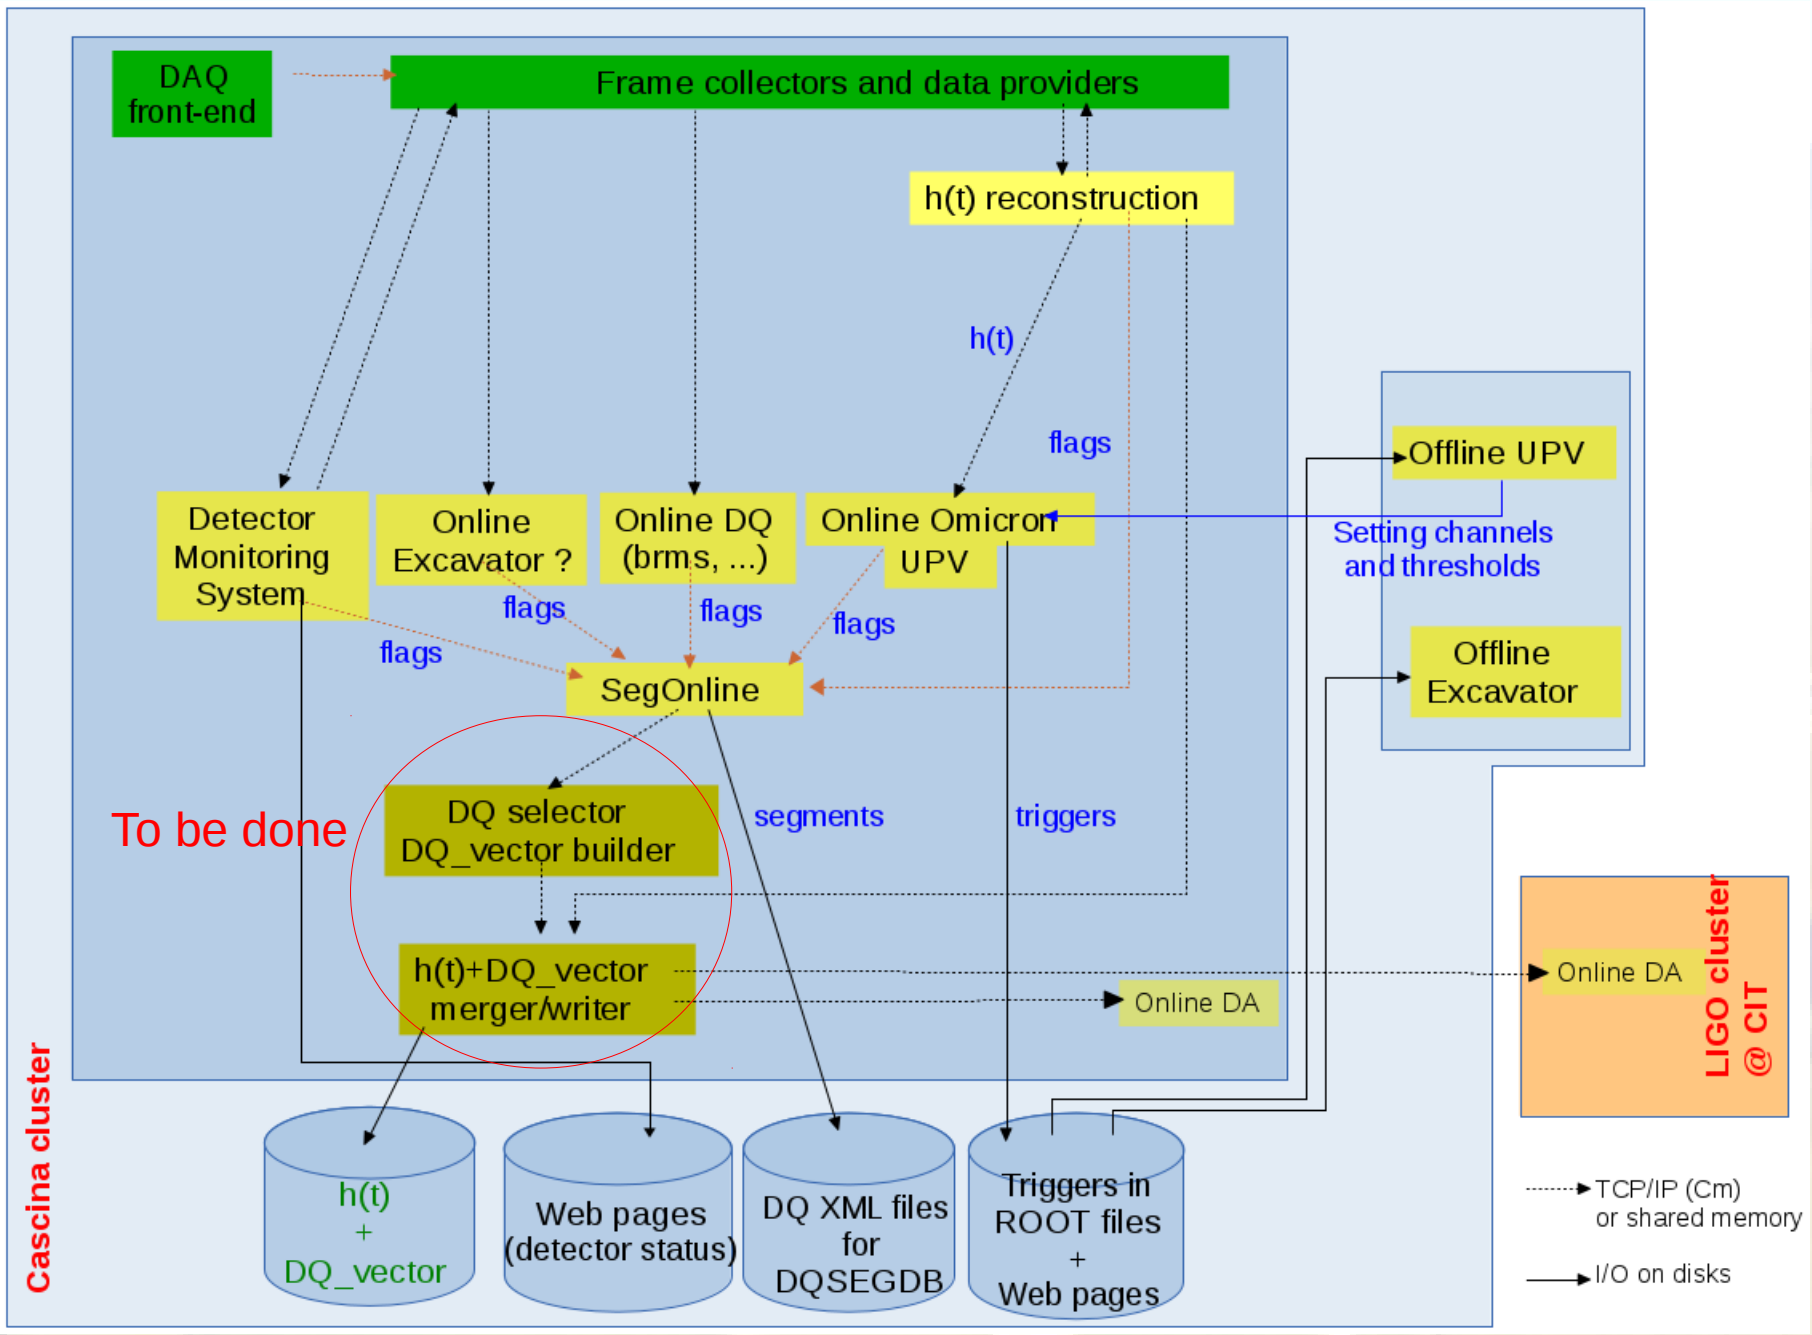

- DAQ software architecture mainly as in Virgo
- Online writing/reading frame data on “files in shared memory” (/dev/shm/)
- Different data streams written on disk at Cascina
 - **RDS stream: channels at 50 Hz + other channels still to be selected**

Online $h(t)$ and data quality at Cascina: sketch

Online $h(t)$ and data quality at Cascina: sketch

Online $h(t)$ and data quality at Cascina: to do's

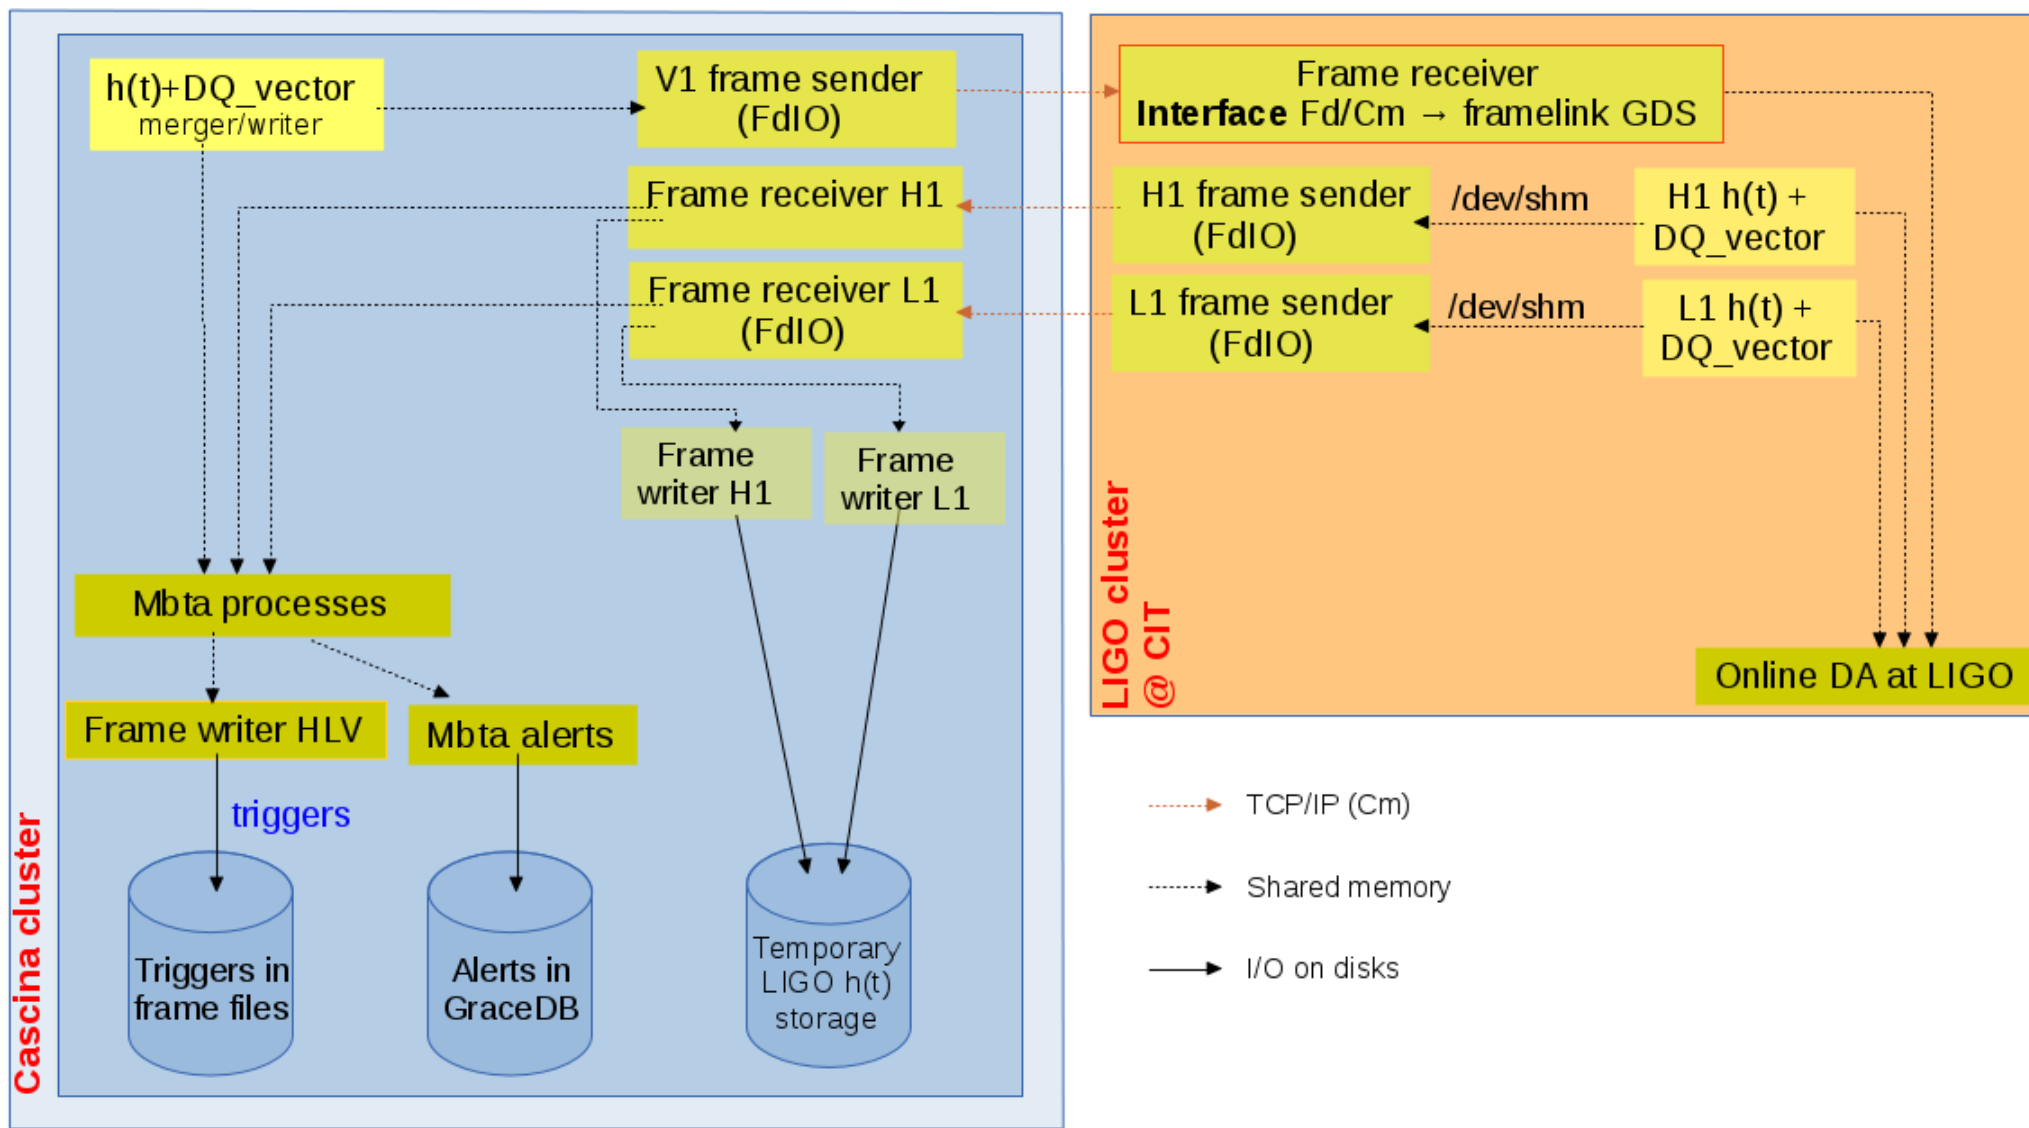

Online DQ:

- **DQ selector** : what cat1,cat2 DQ flags are selected ?
- Monitor the online DQ production and transfer
- Monitor the DQ safety and DQ performance
- An architecture for offline DQ reprocessing
- DQSEGDB server and client
 - One server or two synchronized DB ?

DetChar tools

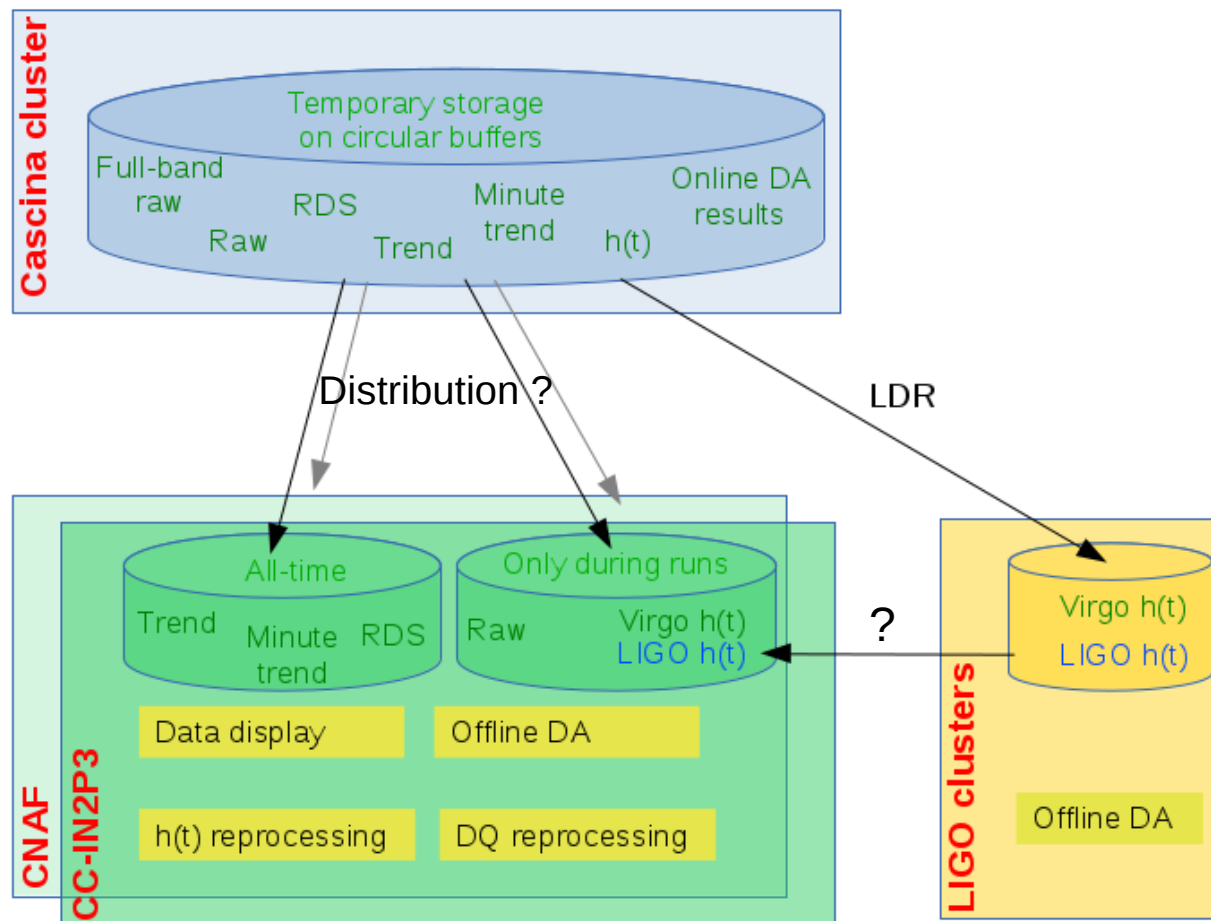

- | | |
|--|--|
| <ul style="list-style-type: none"> • Channels DB (need update and links. We look at CIS) • A web page similar to LigoCAM • A central summary page to be used by commissioning users • Tool to find glitch families ? | <ul style="list-style-type: none"> • MonitoringWeb (similar to Summary pages + LigoDV) • UPV, Excavator web pages • Noemi, Coherence web pages • NMAPI |
|--|--|

Low latency data transfers (and mbta data analysis)

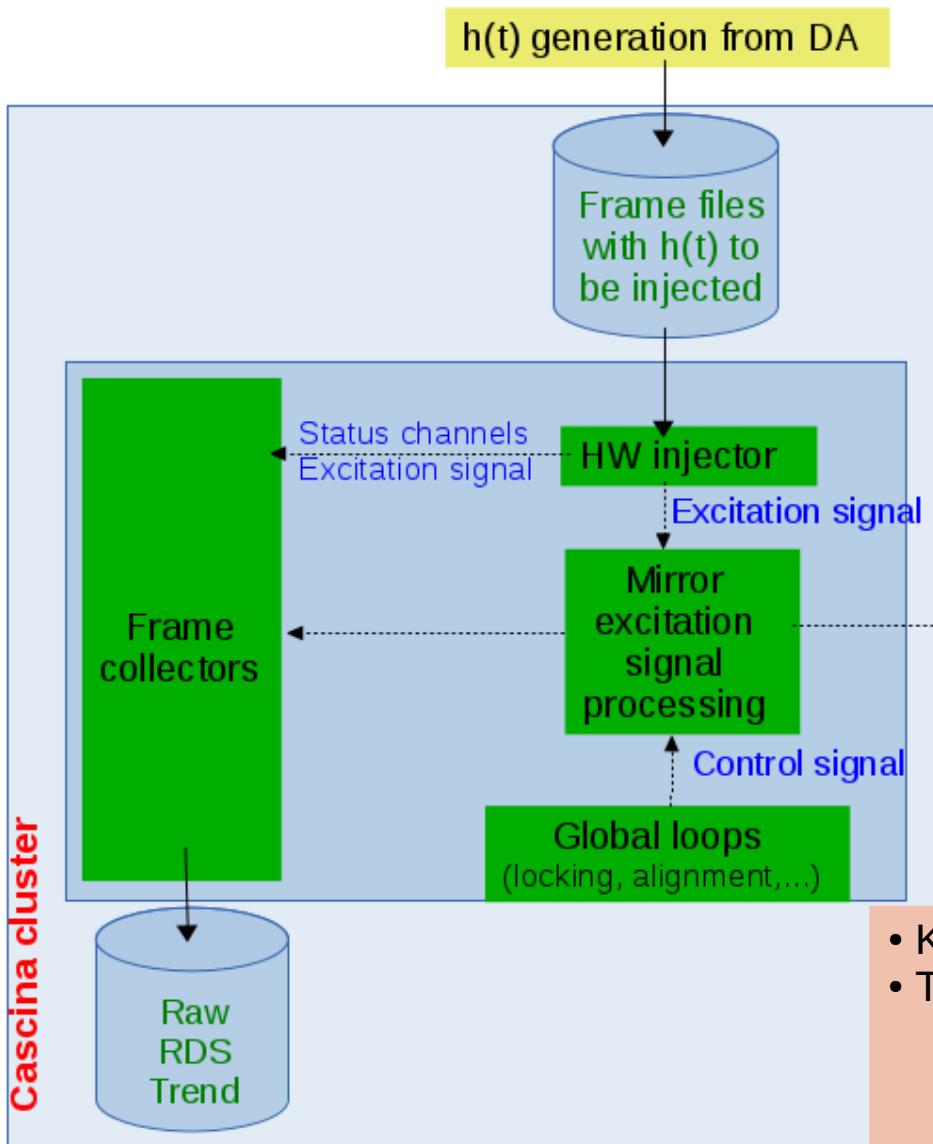

- Online data transfer architecture and software already running for ER runs

Virgo data storage and offline data analysis

- **Virgo data transfer to CCs:**
 - Continuous transfer of Trend and RDS to CCs for storage
 - Transfer of raw and h(t) during science runs + calibration + astrowatch periods
- **LIGO ↔ Virgo data transfers:**
 - h(t) (+ DQ_vector): online streams and reprocessed data
 - **RDS transfer needed ? Can make Virgo RDS available through LDR from Cascina**
 - **Need to define how/where the data are pushed and get on each side**
- **Tools for Virgo transfer (+monitoring) being tested for choice and setup**

Hardware injections at Virgo: sketch

HW injector:

- check presence of $h(t)$ to be injected in some directories (CBC/, Bursts/, ...)
- filter $h(t)$ channel w/ mirror actuation calibrated parameters
- generate excitation signal + status channels

- Keep the mechanism and processes developed for Virgo+
- Two processes in parallel:
 - For hardware injections
 - For blind injections

--> blindness mechanism configuration to be setup
- Mirror actuation:
 - Electromagnetic actuators
 - Current goal: use a photon calibrator for blind injections

(Software injections have a similar mechanism)

h(t) and DQ reprocessing

Location of reprocessing:

- Mainly Virgo clusters: CCIN2P3 and CNAF

DQ reprocessing

- Output: new version of segments in DQSEGDB
- **Software architecture for DQ reprocessing to be setup in the CCs**

h(t) reprocessing

- Output: new frame files with h(t) time series (w/o DQ_vector)
- Transfer the new frame files to LIGO clusters

Offline analysis

- Use selected/last version of segments in DQSEGDB
- Use latest version of h(t) (no need of DQ_vector since info in DQSEGDB)
